

NSE Module Offerings

Metro Bundle

The Nomadix Metro Bundle combines the Credit Card, High Availability, and Routed Subscriber modules into a single package to optimize performance in environments in which both high user volume and high availability are required.

The bundle can support up to 4000 simultaneous users, and through the High Availability features is well suited for situations in which downtime must be minimized. The Routed Subscriber option provides the ability to support a layer-3 infrastructure on the subscriber side of the Nomadix Gateway.

The Metro Bundle is available as a special AG5500 platform only. The bundle does not support the port-location, port-based policy, network-side 802.1Q VLAN tagging, Quality of Service, MAC-authentication, and Hospitality module features.

The Metro Module can support up to 4000 individual subscribers. A Metro subscriber-side network can also utilize a Routed Subscriber configuration.
